Full Site SEO Audit

pipelinersusa.com | Prepared by TAG Marketing | July 13, 2026

Coverage: On-Page, Off-Page & Technical SEO (incl. site speed). Sources: Search Atlas / Google Search Console (90 days: Apr 13 - Jul 10, 2026), Search Atlas GBP + rank-tracking + AI-visibility modules, live crawl of robots.txt / sitemaps / representative pages, and Google PageSpeed Insights (run live via browser, Jul 13 2026). Scope: ~120 indexable URLs (1 home, ~10 service pages, 37 city pages, ~45 blog posts, taxonomy + template fragments).

Performance Snapshot (Google Organic, 90 days)

Metric	Value	Read
Clicks	106	Very low
Impressions	56,614	High - visibility exists
CTR	0.19% (US non-brand ~0%)	Critical
Avg position	25 overall / 45.85 US	Everything on page 3-5
Indexed pages w/ data	89	OK

Health Scorecard

Area	Grade	Notes
On-Page SEO	POOR	Duplicate city pages, multi-H1, missing metas, no title template
Off-Page - Local/GBP	GOOD	95% profile, 88 GBP score, 123 reviews @ 4.99 stars
Off-Page - Citations/Links	POOR	Citation score 37/100, only 15 citations
Off-Page - AI visibility	MODERATE	#1 but lead is razor-thin vs 3 competitors
Technical SEO	MODERATE	robots.txt fine; sitemap architecture broken; index bloat
Site Speed (mobile)	POOR	PSI 21/100; LCP 6.3s; ~16.9 MB page weight
Rankings / positions	POOR	Nothing top-10 non-brand; money terms declining

The Headline Problem

The site is **seen but never clicked**. 56,614 impressions produced just 106 clicks, and almost every click is **branded**. Nothing ranks top-10 for a commercial term. You have demand, a strong Google Business Profile, and full indexation - but the website itself is held back by three compounding problems: **near-duplicate city pages** (on-page), a **thin citation/link footprint** (off-page), and a **heavy, slow Elementor build** (technical). Google has the pages indexed and simply parks them on page 3-4.

ON-PAGE SEO

1. City pages are templated duplicates - the #1 traffic blocker

The 37 city pages share large identical boilerplate blocks (confirmed by pulling live body text):

- **Tempe** and **Paradise Valley** open with the word-for-word same block ("Unlike conventional plumbing methods... save up to 30%... Trenchless sewer repair largely eliminates waste...").

- **Chandler** and **Tempe** share the same "Pipe lining is a refined method..." intro.
- Local customization is **inconsistent**: Chandler/Tempe have real local detail; **Paradise Valley is almost entirely generic**. Google reads these as near-duplicate doorway pages and caps them at position 30-38 despite big impressions (Tempe 2,150; Paradise Valley 1,447).

2. Systemic multiple-H1 problem (Elementor)

Every page codes section headings as H1: Homepage **3**, Tempe **4**, Paradise Valley **2**, Chandler **8**. Should be one H1/page - a global template fix.

3. No title-tag template + missing meta descriptions

Three different title formats across three city pages; meta descriptions absent on homepage and all sampled city pages. Standardize titles (e.g. **Trenchless Pipe Repair in {City}, AZ | Pipeliners USA**) and write unique metas.

4. Reviews shown as badges, not text

City pages display a "5 stars" Google badge but no on-page review text or Review schema - a missed trust + rich-result signal, especially given 123 real 5-star reviews exist.

OFF-PAGE SEO

Strong local presence, weak link/citation footprint.

5. Google Business Profile is a genuine asset (keep it up)

GBP signal	Value
Profile completeness	95.24%
GBP score	88 / 100
Reviews	123 (4.99 stars avg)
Reviews replied	123 / 123 (100%)
Local map avg rank	3 (only 4 keywords tracked)
GBP posts published	111

6. Citations are the off-page weak spot

Citation score **37/100** with only **15 citations**. Local rankings lean heavily on consistent NAP citations across directories - this is thin for a market this competitive. **Action:** run a citation-building campaign (aggregators + niche/local directories) and audit NAP consistency.

7. AI-search visibility: leading, but by a whisker

In AI/LLM search (Search Atlas AI-visibility), pipelinersusa is **#1** - but the lead is razor-thin and closing:

Domain	AI visibility score
pipelinersusa.com (you)	**35.1**
nuflow.com	33.8
whyrepipe.com	33.1
epipe.com	31.8
nuflowphoenix.com	21.2

AI share-of-voice is 27% (227 brand mentions). AI engines pull citations from **Reddit, YouTube, Yelp, BBB, and Facebook** - where competitors appear more often. **Action:** seed and strengthen presence on those exact sources to defend the #1 AI position.

TECHNICAL SEO

8. Sitemap architecture is broken / contradictory

- robots.txt points to **sitemap_index.xml**, which references **only sitemap.xml** (a flat 138-URL file).
- GSC still has **3 stale sitemaps** submitted: page-sitemap.xml + post-sitemap.xml (old **Yoast** names - you are on Rank Math now) plus sitemap_index.xml carrying **1 warning**.
- Fix: in GSC remove the old Yoast sitemaps, keep only the current index, resolve the warning.

9. Index bloat - junk URLs in the sitemap

- /pixfooter-item/pipeliners-footer/ (Elementor footer fragment) and /pixpopup-item/cookie-policy-popup-elementor/ (popup template) - both thin, both indexable.
- /category/uncategorized/ + 9 other category archives + 5 tag archives - thin taxonomy pages. Set all to noindex and drop from the sitemap.

10. Passing technical checks

robots.txt is correct (blocks only wp-admin); pages return HTTP 200; images load post-migration; HTTPS active; Lighthouse SEO 92, Accessibility 94-95, Best Practices 96. Note: canonical/JSON-LD schema is injected dynamically by OTTO - verify in the OTTO dashboard, not WP source.

11. Site Speed - PageSpeed Insights (live, Jul 13 2026)

Metric	Mobile	Desktop	Target
Performance score	**21 (POOR)**	**51 (needs work)**	90+
First Contentful Paint	**2.6 s**	**0.7 s**	< 1.8 s
Largest Contentful Paint	**6.3 s**	**2.3 s**	**< 2.5 s**
Total Blocking Time	**2,140 ms**	**1,570 ms**	< 200 ms
Cumulative Layout Shift	**0.331**	0.005	< 0.1
Speed Index	**8.7 s**	**3.3 s**	< 3.4 s

Real-user (CrUX) field data: **No Data** - traffic too low for Google to report field vitals. Scores above are lab (Moto G Power / Slow 4G for mobile). Mobile is the priority: LCP 6.3s and CLS 0.331 are both in the red, and mobile is where most local searches happen.

Root causes (from PSI diagnostics):

- **~16.9 MB total page weight** - enormous; unoptimized images + scripts.
- **1,738 KiB unused JavaScript** + 97 KiB unused CSS (Elementor/plugin bloat).
- **1,360 ms render-blocking** resources; 8.2 s main-thread work; 20 long tasks; 9 non-composited animations.
- Inefficient cache lifetimes (320 KiB); more than 4 preconnect origins.

Fix path: compress/serve images as next-gen sizes, defer + reduce JS, enable caching, trim unused CSS/JS, and set explicit image dimensions to kill the mobile layout shift (CLS).

PRIORITIZED ROADMAP

#	Action	Pillar	Impact
1	De-duplicate the 37 city pages - replace shared boilerplate with unique local content (neighborhoods, permit/soil specifics, project photos, city reviews). Start with Tempe, Paradise Valley, Peoria, Sun City, Florence, Avondale.	On-Page	HIGH
2	Fix site speed - image compression, defer/trim JS (-1.7 MB), caching, set image dimensions. Target mobile LCP < 2.5s and CLS < 0.1.	Technical	HIGH
3	Global on-page template fix - one H1/page; standardized title + meta-description templates.	On-Page	HIGH
4	Citation-building campaign + NAP audit (raise from 15 citations / score 37).	Off-Page	MED
5	Clean GSC sitemaps, noindex template/taxonomy junk, resolve sitemap warning.	Technical	MED
6	Add review text + Review schema to city/service pages.	On-Page	MED
7	Defend AI-search #1 - seed Reddit/YouTube/Yelp/BBB presence.	Off-Page	MED

APPENDIX A - SITE SPEED FIX PLAN

Turns the PageSpeed Insights diagnostics (mobile 21 / desktop 51) into an ordered developer task list. Site is WordPress + Elementor, so fixes assume that stack. Target after completion: **mobile Performance 50+, LCP < 2.5s, CLS < 0.1, TBT < 300ms.**

Current vs. target

Vital	Mobile now	Desktop now	Target
LCP (loading)	**6.3 s**	**2.3 s**	< 2.5 s
TBT (interactivity)	**2,140 ms**	**1,570 ms**	< 200 ms
CLS (visual stability)	**0.331**	**0.005**	< 0.1
Total page weight	**~16.9 MB**	**~16.9 MB**	< 2-3 MB

Prioritized fixes

#	Issue (PSI)	Fix	How / tool	Gain
1	~16.9 MB page weight; oversized images	Compress + convert all images to WebP/AVIF, serve responsive srcset at real display sizes, lazy-load below-the-fold	Imagify / ShortPixel / EWWW; WP responsive images	**HIGH**
2	LCP 6.3s (mobile hero)	Preload the hero LCP image, serve it at correct dimensions, remove anything render-blocking above it	<link rel=preload> hero; Elementor image settings	**HIGH**
3	1,738 KiB unused JS; TBT 2,140ms	Dequeue unused plugin/Elementor JS per-page; defer + delay non-critical scripts until interaction	Perfmatters / Asset CleanUp; WP Rocket 'Delay JS'	**HIGH**
4	Mobile CLS 0.331	Set explicit width/height on every image; reserve space for sliders, review badges, and late-injected elements	Add dimensions in theme/Elementor; avoid above-fold injects	**HIGH**
5	1,360 ms render-blocking CSS/JS	Inline critical CSS, defer the rest; load fonts with font-display: swap	WP Rocket / Autoptimize	**MED**
6	97 KiB unused CSS	Remove unused CSS (Elementor global stylesheet is heavy)	Perfmatters / WP Rocket 'Remove Unused CSS'	**MED**
7	Inefficient cache (320 KiB); no CDN	Set long cache headers on static assets; put site behind a CDN	Cloudflare / WP Rocket caching	**MED**
8	9 non-composited animations; >4 preconnects; legacy JS	Disable Elementor entrance animations on mobile; trim preconnect hints to 2-3 origins; drop legacy JS polyfills	Elementor motion settings; theme header cleanup	**LOW**

Recommended stack (Elementor sites): WP Rocket (caching, delay JS, critical CSS) + an image optimizer (Imagify/ShortPixel) + Cloudflare CDN covers items 1, 3, 5, 6, 7 in one pass. Do items 1-4 first - they drive the mobile LCP/CLS/TBT numbers that Google actually ranks on.

Re-test after each batch at pagespeed.web.dev (mobile view) and watch LCP and CLS specifically - those two are currently the red flags dragging the mobile score to 21.

Note: Audited pipelinersusa.com (working project). Canonical/schema verified via OTTO dashboard, not WP source, because OTTO injects structured data dynamically.
