# Module 5: On-Page SEO for Your Website

2:27

**Overview:** Now that we know our keywords, optimizing the business's **website is time**. On-page SEO means tweaking your site's content and HTML elements to signal relevance to search engines. In this module, you'll learn best practices for local on-page optimization: writing title tags and meta descriptions that include your location and keywords, using headings and content to highlight your services in your area, and ensuring your site's **NAP (Name, Address, Phone)** details are visible to both visitors and Google. We'll also cover technical basics like ensuring your site is mobile-friendly and loads quickly – which are crucial for SEO (Google favors fast, mobile-optimized sites). By implementing these changes, your website will better support your Google Business Profile and improve its chances of ranking in organic results.

to craft these for local SEO. **Include the city/area and a primary keyword in your title tag**, preferably near the beginning. For example: *"Vancouver Plumbing Services – 24/7 Plumber in Vancouver, BC"*. Keep titles around 50–60 characters so they don't get cut off. Meta descriptions should also mention the city and a selling point or call-to-action – they don't directly affect rankings, but a compelling meta can increase click-throughs. Each page's title and description should be unique and focus on the specific service/keyword for that page. We'll show a before-and-after of a good local title/meta.

2. **Using Headers and Content Effectively** – Ensure your website's **headings (H1, H2, etc.) and body text** naturally incorporate your target local keywords. For example, the homepage might have an H1 saying "Best Plumber in Dallas – Quality Plumbing Services in Dallas, TX." This immediately tells Google and users what you do and where. Throughout your site's content, mention your location alongside services (but keep it readable – don't stuff keywords unnaturally). Also, create dedicated pages if you serve multiple locations or offer distinct services – this way each page can target a specific set of keywords. We cover internal linking too: link between pages on your site using descriptive anchor text (e.g., on the homepage, a link to the Contact page could say "Contact our Dallas office" – reinforcing location).

3. **Displaying NAP and Schema** – Your site must list your **Name, Address, and Phone number (NAP)** – ideally on every page (commonly in the footer or header) and certainly on a Contact or Contact Us page. Consistent NAP info on your site that matches your Google Business Profile boosts credibility. We also introduce **LocalBusiness Schema markup** (which we'll delve into in Module 6), a way to mark up your address and other details in the site's code so search engines can easily parse it. Even before adding schema, simply having a contact page with the full business address and phone number is a strong signal. We suggest embedding a Google Map on the contact page as

4. **Image Optimization** – Images on your site can also be optimized for local SEO. We share tips like **compressing images** (to improve site load speed, since page speed is a Google ranking factor) and using descriptive file names and alt text. For example, an image of your storefront could be named "storename-dallas-location.jpg" and have alt text "StoreName storefront in Dallas, Texas." This way, you tell Google what's in the image and reinforce location keywords. A faster, well-described site improves both user experience and SEO performance.

5. **Mobile-Friendly and Fast** – We remind you that many local searches happen on mobile devices. Google now uses *mobile-first indexing*, primarily checking your site's mobile version for ranking. So your site **must** work well on phones and tablets. Ensure your site is responsive (most modern website builders/themes are). Also, check your site speed using tools like Google PageSpeed Insights. Consider optimizations (image compression, caching, etc.) if the site is slow. A fast, mobile-friendly site ranks better and keeps visitors (potential customers) from bouncing away.

**Implementation Steps:**

- **Optimize Title Tags:** Edit the HTML title tag of each key page (homepage, service pages, etc.). Insert the target keyword and location. For a single-location business, include the city in the homepage title. For example: `<title>Reliable HVAC Repair in Miami, FL | [BrandName] Heating & Cooling</title>` . Keep it under ~60 characters. Do similar for other pages (e.g., Service pages: "Furnace Installation – Miami Heating Services | BrandName").

- **Write Compelling Meta Descriptions:** For each page, write a 1-2 sentence meta description that includes the city and a call-to-action or value proposition. E.g., *"[BrandName] offers fast, affordable HVAC repair in Miami, FL. Call 24/7 for expert heating and cooling service."* Remember, while meta descriptions don't directly rank you, they **influence click-through rate**, which can indirectly help SEO. Add these to your site's HTML or through your CMS/SEO plugin.

heading is generic, tweak it: for instance, change “Our Lawn Care Services” to “Our Lawn Care Services in **San Diego**”. Work in your target keywords naturally throughout the text. Also add a section on the homepage or about page highlighting that you serve the “[City] community” or similar, to reinforce local relevance.

- **Add Business Contact Info Site-Wide:** Place your business name, address, and phone number in the footer of your site (or header/top bar if you prefer), exactly as they appear on Google. Also ensure your “Contact Us” page has this info in text (not just in an image). You might also add a Google Map embed on the contact page showing your location. These steps make it easy for search engines and users to see your location details.

- **Improve Site Speed & Mobile UX:** Test your site on a mobile device. Check that it loads quickly and that all content is accessible without pinching/zooming. Use free tools like **Google’s Mobile-Friendly Test** and **PageSpeed Insights**. If issues are found (like text too small on mobile, or slow load due to large images), take action: enable a mobile-responsive theme, compress images, consider a caching plugin or better hosting if needed. This technical tune-up is part of on-page SEO because Google penalizes slow or not mobile-friendly sites.

**Milestone:** *By the end of Module 5, the business’s website will be fully optimized on-page for local SEO.* You’ll have location-targeted title tags and meta descriptions, content highlighting the business’s services and area, and prominently displayed contact info. The site will also have a solid technical footing (fast and mobile-ready). This means when Google crawls the site, it will clearly understand **who you are, what you do, and where you do it**, which is fundamental for ranking in local searches. Moreover, users who visit the site will quickly see that this business serves their area and offers what they need, increasing the chances they will become customers.
